Outline

Plate bending problem

- A fourth-order problem
- A fourth-order singularly perturbed problem

Finite element method

Conforming finite element method Nonconforming finite element method

Adini element for a fourth-order singularly perturbed problem Boundary-layer structure of typical solutions Convergence results Numerical results

A fourth-order problem: plate bending problem Boundary value problem:

$$\Delta^2 u(x, y) = f(x, y) \quad \text{in } \Omega := (0, 1)^2,$$
$$u(x, y) = \frac{\partial u(x, y)}{\partial n} = 0 \quad \text{on } \partial\Omega,$$

A linear model for a clamped thin elastic plate. u(x, y): displacement of the plate. f(x, y): transverse loading.

A fourth-order singularly perturbed problem

Boundary value problem:

$$\varepsilon^2 \Delta^2 u(x,y) - \Delta u(x,y) = f(x,y) \quad \text{in } \Omega := (0,1)^2,$$

 $u(x,y) = \frac{\partial u(x,y)}{\partial n} = 0 \quad \text{on } \partial \Omega,$

where $0 < \varepsilon \ll 1$ and $f(x, y) \in L^2(\Omega)$ is a smooth function. ε^2 is the ratio of bending rigidity to tensile stiffness in the plate.

Aim and difficulty

- Aim: solve the problem by robust numerical method that work for all values of the singular perturbation parameter ε, even it is very small.
- Difficulty: layers in derivative of typical solution (1D graph, $\varepsilon = 10^{-2}$)

Weak form of the boundary value problem

Weak form: Find $u \in H^2_0(\Omega)$, such that

$$a(u,v) = (f,v) \quad \forall v \in H_0^2(\Omega).$$

Bilinear form a(w, v) defined as:

$$\mathsf{a}(w,v) := \varepsilon^2 \sum_{i,j=1}^2 \left(\frac{\partial^2 w}{\partial x_i \partial x_j}, \frac{\partial^2 v}{\partial x_i \partial x_j} \right) + (\nabla w, \nabla v) \quad \forall w, v \in H^2(\Omega).$$

The following semi-norm is naturally associated with the problem:

$$\|v\|_arepsilon:= ig(arepsilon^2|v|_2^2+|v|_1^2ig)^{1/2} \quad orall v\in H^2_0(\Omega);$$

by the Poincaré inequality it is a norm on $H_0^2(\Omega)$.

Outline

Finite element method

Conforming finite element method Nonconforming finite element method

Adini element for a fourth-order singularly perturbed problem Boundary-layer structure of typical solutions Convergence results Numerical results

Conforming finite element method

- ▶ For fourth order problems, conforming finite element space $V_h \subseteq H^2$, which means $V_h \subseteq C^1$.
- For triangular mesh, Argyris element, 21 parameters, polynomials of degree 5.
- For tetrahedral mesh, Zenicek element, 220 parameters, polynomials of degree 9.

We are interested in decreasing the number of nodal parameters and the degree of polynomials.

Nonconforming finite element method

- ▶ For fourth order problems, nonconforming finite element space $V_h \nsubseteq H^2$, which means $V_h \nsubseteq C^1$.
- Do not introduce new variables.
- Decrease the number of nodal parameters and the degree of polynomials.

• We need to analysis more items (consistency error).

A nonconforming element: Adini element

- element K is a rectangle.
- shape function space is

$$P_{\mathcal{K}} = Q_1(\mathcal{K}) \oplus x^2 Q_1(\mathcal{K}) \oplus y^2 Q_1(\mathcal{K})$$
$$= P_3(\mathcal{K}) \oplus \{xy^3, x^3y\},$$

where $Q_1 = \{x^i y^j | i, j \le 1\}$ and $P_3 = \{x^i y^j | i + j \le 3\}$.

degrees of freedom are

$$\mathbf{D}_{\mathcal{K}}(\mathbf{v}) = \left\{ \mathbf{v}(\mathbf{a}_i), \frac{\partial \mathbf{v}(\mathbf{a}_i)}{\partial x}, \frac{\partial \mathbf{v}(\mathbf{a}_i)}{\partial y}, i = 1, 2, 3, 4 \right\}.$$

Anisotropic interpolation error estimates

Lemma

Let Π_N be the interpolation operator using the degrees of freedom of Adini element, $K = 2h_1 \times 2h_2$, $\phi \in H^3(K)$. Not only

$$\left|\phi - \mathsf{\Pi}_{\mathsf{N}}\phi\right|_{\mathsf{1},\mathsf{K}} \leq Ch^2 \left|\phi\right|_{\mathsf{3},\mathsf{K}},$$

but also we have

$$\left\|\frac{\partial(\phi-\Pi_N\phi)}{\partial x}\right\|_{0,\kappa} \leq C\left(h_1^2 \left\|\frac{\partial^3\phi}{\partial x^3}\right\|_{0,\kappa} + h_1h_2 \left\|\frac{\partial^3\phi}{\partial x^2\partial y}\right\|_{0,\kappa} + h_2^2 \left\|\frac{\partial^3\phi}{\partial x\partial y^2}\right\|_{0,\kappa}\right).$$

Stability of the Adini interpolation operator

Define

$$\|f\|_{1,\infty,\mathcal{K}}:=\max_{|\alpha|\leq 1}\|D_w^{\alpha}f\|_{L^{\infty}(\mathcal{K})}.$$

Lemma

There exists a constant C, which is independent of K and ϕ , such that

 $\|\Pi_N \phi\|_{1,\infty,K} \le C \|\phi\|_{1,\infty,K}$

for each mesh rectangle K and each $\phi \in C^1(K)$.

Thanks to the Adini element's symmetrical nature.

Outline

Plate bending problem

- A fourth-order singularly perturbed problem

Finite element method

Conforming finite element method Nonconforming finite element method

Adini element for a fourth-order singularly perturbed problem Boundary-layer structure of typical solutions Convergence results Numerical results

Behaviour of the solution

Theorem

There is a constant C, independent of ε and f, such that

$$|u|_{2} \leq C \varepsilon^{-1/2} \|f\|_{0}$$
 and $|u|_{3} \leq C \varepsilon^{-3/2} \|f\|_{0}$

for all $f \in L^2$.

To give a sketch of proof, we need the following reduced problems: The reduced equation:

$$\begin{aligned} -\Delta u^0(x,y) &= f(x,y) \quad \text{in } \Omega := (0,1)^2, \\ u^0(x,y) &= 0 \quad \text{on } \partial \Omega. \end{aligned}$$

The reduced weak form: Find $u^0 \in H^1_0(\Omega)$, such that

$$(\nabla u^0, \nabla v) = (f, v) \quad \forall v \in H^1_0(\Omega).$$

Behaviour of the solution: sketch of proof

Subtract reduced equation from fourth order singularly perturbed equation:

$$\Delta^2 u(x,y) = \varepsilon^{-2} \Delta(u-u^0),$$

then

$$\|u\|_3 \leq C\varepsilon^{-2}|u-u^0|_1.$$

Subtract reduced weak form from fourth order singularly perturbed weak form:

$$\varepsilon^2(\Delta u, \Delta u) + (\nabla(u-u^0), \nabla(u-u^0)) = -\varepsilon^2 \int_{\partial\Omega} \Delta u \frac{\partial u^0}{\partial n} \mathrm{d}s - \varepsilon^2(\Delta u, f),$$

then

$$\varepsilon^{2}|u|_{2}^{2}+|u-u^{0}|_{1}^{2}\leq C\varepsilon ||f||_{0}^{2}.$$

Above all

$$|u|_2 + \varepsilon |u|_3 \leq C \varepsilon^{-1/2} ||f||_0.$$

Solution decomposition

The boundary value problem has a solution u which can be decomposed as

$$u = S + \sum_{i=1}^{4} E_i + E_{12} + E_{23} + E_{34} + E_{41},$$

- S: smooth part;
- E_i : boundary layer part along side *i* of $\overline{\Omega}$;
- E_{ij} : corner layer part at the corner (i, j).

Remark

We will assume the pointwise bounds from our experience with second-order singularly perturbed problems.

The pointwise bounds of Assumption are reasonable, because they are consistent with the Sobolev-norm global estimates.

Solution decomposition

There exists a constant C such that

$$\left\|\frac{\partial^{i+j}S}{\partial x^i\partial y^j}\right\|_{0,\Omega}\leq C,$$

and for all $(x, y) \in \overline{\Omega}$ one has

$$\begin{aligned} \left| \frac{\partial^{i+j} E_1(x,y)}{\partial x^i \partial y^j} \right| &\leq C \varepsilon^{1-j} e^{-y/\varepsilon}, \\ \left| \frac{\partial^{i+j} E_2(x,y)}{\partial x^i \partial y^j} \right| &\leq C \varepsilon^{1-i} e^{-x/\varepsilon}, \\ \left| \frac{\partial^{i+j} E_{12}(x,y)}{\partial x^i \partial y^j} \right| &\leq C \varepsilon^{1-i-j} e^{-x/\varepsilon} e^{-y/\varepsilon} \end{aligned}$$

for $0 \le i + j \le 4$ and similarly for the remaining components of the decomposition.

,

Shishkin mesh

Define the transition point parameter (positive constant α will be chosen later):

 $\lambda = \alpha \varepsilon \ln N.$

Figure: A rectangular Shishkin mesh with N = 8

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

Finite element problem

Adini finite element discretisation is: find $u_N \in V_{N0}$ such that

$$a_N(u_N,v_N)=(f,v_N) \quad \forall v_N \in V_{N0},$$

where we define

$$a_N(w_N, v_N) := \sum_{K \in \mathcal{T}_N} \left[\varepsilon^2 \sum_{i,j=1}^2 \left(\frac{\partial^2 w_N}{\partial x_i \partial x_j}, \frac{\partial^2 v_N}{\partial x_i \partial x_j} \right)_K + (\nabla w_N, \nabla v_N)_K \right]$$

For any function v defined on Ω that lies in $H^2(K)$ for all $K \in \mathcal{T}_N$, define "broken" semi-norms by

$$|\boldsymbol{v}|_{1,\boldsymbol{N}}^2 := \sum_{K\in\mathcal{T}_{\boldsymbol{N}}} |\boldsymbol{v}|_{1,K}^2 \text{ and } |\boldsymbol{v}|_{2,\boldsymbol{N}}^2 := \sum_{K\in\mathcal{T}_{\boldsymbol{N}}} |\boldsymbol{v}|_{2,K}^2,$$

and

$$\|v\|_{\varepsilon,N} := \left(\sum_{K \in \mathcal{T}_N} \|v\|_{\varepsilon,K}^2\right)^{1/2} \quad \text{where} \quad \|v\|_{\varepsilon,K}^2 := \varepsilon^2 |v|_{2,K}^2 + |v|_{1,K}^2.$$

The second Strang Lemma

Lemma

There exists a constant C such that

$$\|u-u_N\|_{\varepsilon,N} \leq C\left(\inf_{v_N \in V_{N0}} \|u-v_N\|_{\varepsilon,N} + \sup_{w_N \in V_{N0}} \frac{|F_N(u,w_N)|}{\|w_N\|_{\varepsilon,N}}\right),$$

where

$$F_{N}(u, w_{N}) := \varepsilon^{2} \sum_{K \in \mathcal{T}_{N}} \int_{\partial K} \frac{\partial^{2} u}{\partial n_{K}^{2}} \frac{\partial w_{N}}{\partial n_{K}} \, \mathrm{d}s,$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

with t_K , n_K denote unit tangential and normal vectors on ∂K .

Approximation error estimate

Theorem

There exists a constant C, which is independent of ε and N, such that

$$\inf_{\nu_N \in \mathcal{V}_{N0}} \| u - \nu_N \|_{\varepsilon,N} \leq \| u - \Pi_N u \|_{\varepsilon,N}$$

$$\leq C \left[\varepsilon^{1/2} (N^{-1} \ln N)^2 + \varepsilon N^{1-\alpha} + N^{-\alpha} + N^{-3} \right],$$

choose $\alpha \geq$ 3 then

$$\inf_{v_N \in V_{N0}} \|u - v_N\|_{\varepsilon,N} \leq C \left[\varepsilon^{1/2} (N^{-1} \ln N)^2 + N^{-3}\right].$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへ⊙

Approximation error estimate: sketch of proof

$$\|E_{1} - \Pi_{N}E_{1}\|_{\varepsilon,N}^{2} = \|E_{1} - \Pi_{N}E_{1}\|_{\varepsilon,N,\Omega_{1}}^{2} + \|E_{1} - \Pi_{N}E_{1}\|_{\varepsilon,N,\Omega_{2}}^{2}$$

- Image: ||E₁ − Π_NE₁||²_{ε,N,Ω1}: Anisotropic interpolation error estimates of the Adini interpolation operator.
- ► $||E_1 \prod_N E_1||^2_{\varepsilon,N,\Omega_2} \le ||E_1||^2_{\varepsilon,\Omega_1} + ||\prod_N E_1||^2_{\varepsilon,N,\Omega_1}$: Stability of the Adini interpolation operator.

Consistency error estimate

Theorem

There exists a constant C, which is independent of ε and N, such that

$$\sup_{w_N \in V_{N0}} \frac{|F_N(u, w_N)|}{\|w_N\|_{\varepsilon, N}} \le C \min \left\{ \varepsilon^{1/2}, \varepsilon^{-3/2} N^{-2} \right\}.$$

Consistency error estimate: sketch of proof

Use the properties of Adini element (weak continuous and symmetry), we have second order convergence rate:

$$\begin{split} F_{N}(u, w_{N}) &= \varepsilon^{2} \sum_{K \in \mathcal{T}_{N}} \int_{\partial K} \frac{\partial^{2} u}{\partial n_{K}^{2}} \frac{\partial w_{N}}{\partial n_{K}} \, \mathrm{d}s \\ &\leq C \varepsilon^{2} \sum_{K \in \mathcal{T}_{N}} \left(h_{1}^{2} \left\| \frac{\partial^{4} u}{\partial y^{4}} \right\|_{0, K} \left\| \frac{\partial^{2} w_{N}}{\partial x^{2}} \right\|_{0, K} + h_{1}^{2} \left\| \frac{\partial^{3} u}{\partial x \partial y^{3}} \right\|_{0, K} \left\| \frac{\partial w_{N}}{\partial x \partial y} \right\|_{0, K} \\ &+ h_{2}^{2} \left\| \frac{\partial^{4} u}{\partial x^{4}} \right\|_{0, K} \left\| \frac{\partial^{2} w_{N}}{\partial y^{2}} \right\|_{0, K} + h_{2}^{2} \left\| \frac{\partial^{3} u}{\partial x^{3} \partial y} \right\|_{0, K} \left\| \frac{\partial^{2} w_{N}}{\partial x \partial y} \right\|_{0, K} \right). \end{split}$$

Then for singularly perturbed problem on Shishkin mesh, we have:

$$\begin{aligned} \frac{|F_{N}(u, w_{N})|}{\|w_{N}\|_{\varepsilon, N}} &\leq C\varepsilon \bigg[\sum_{K \in \mathcal{T}_{N}} \left(h_{1}^{4} \left\| \frac{\partial^{4} u}{\partial y^{4}} \right\|_{0, K}^{2} + h_{1}^{4} \left\| \frac{\partial^{4} u}{\partial x \partial y^{3}} \right\|_{0, K}^{2} \right. \\ &+ h_{2}^{4} \left\| \frac{\partial^{4} u}{\partial x^{4}} \right\|_{0, K}^{2} + h_{2}^{4} \left\| \frac{\partial^{4} u}{\partial x^{3} \partial y} \right\|_{0, K}^{2} \bigg) \bigg]^{1/2} \\ &\leq C\varepsilon^{-3/2} N^{-2}. \end{aligned}$$

In standard estimate, $\varepsilon^{-3/2} \gg 1$ when $\varepsilon \ll 1$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Consistency error estimate: sketch of proof

Use inverse estimates, to make the bound don't have $\varepsilon^{-3/2}$:

$$\begin{split} F_{N}(u, w_{N}) &= \varepsilon^{2} \sum_{K \in \mathcal{T}_{N}} \sum_{i=1}^{2} \int_{K} \frac{\partial}{\partial x_{i}} \left[\left(\frac{\partial^{2} u}{\partial n_{K}^{2}} - \pi_{0} \frac{\partial^{2} u}{\partial n_{K}^{2}} \right) \left(\frac{\partial w_{N}}{\partial x_{i}} - \pi_{K} \frac{\partial w_{N}}{\partial x_{i}} \right) \right] \, \mathrm{d}x_{1} \, \mathrm{d}x_{2} \\ &\leq C \varepsilon^{2} \sum_{K \in \mathcal{T}_{N}} \sum_{i=1}^{2} \sum_{j=1}^{2} h_{j} \left(\left\| \frac{\partial^{3} u}{\partial x_{i}^{3}} \right\|_{0,K} \right\| \frac{\partial^{2} w_{N}}{\partial x_{i} \partial x_{j}} \right\|_{0,K} + \left\| \frac{\partial^{3} u}{\partial x_{i}^{2} \partial x_{j}} \right\|_{0,K} \left\| \frac{\partial^{2} w_{N}}{\partial x_{i}^{2}} \right\|_{0,K} \right] \\ &\leq C \varepsilon^{2} \sum_{K \in \mathcal{T}_{N}} \left(\left\| \frac{\partial^{3} u}{\partial x^{3}} \right\|_{0,K} \right\| \frac{\partial w_{N}}{\partial x} \right\|_{0,K} + \left\| \frac{\partial^{3} u}{\partial y^{3}} \right\|_{0,K} \left\| \frac{\partial w_{N}}{\partial y} \right\|_{0,K} \\ &+ h_{1} \left\| \frac{\partial^{3} u}{\partial y^{2} \partial x} \right\|_{0,K} \left\| \frac{\partial^{2} w_{N}}{\partial y^{2}} \right\|_{0,K} + h_{2} \left\| \frac{\partial^{3} u}{\partial x^{2} \partial y} \right\|_{0,K} \left\| \frac{\partial^{2} w_{N}}{\partial x^{2}} \right\|_{0,K} \end{split}$$

Consistency error estimate: sketch of proof

Follow last slide, we have

$$\begin{aligned} \frac{F_{N}(u, w_{N})|}{\|w_{N}\|_{\varepsilon, N}} &\leq C\varepsilon^{2} \left(\left\| \frac{\partial^{3}u}{\partial x^{3}} \right\|_{0, \Omega} + \left\| \frac{\partial^{3}u}{\partial y^{3}} \right\|_{0, \Omega} \right) \\ &+ C\varepsilon \left[\sum_{K \in \mathcal{T}_{N}} \left(h_{1}^{2} \left\| \frac{\partial^{3}u}{\partial y^{2}\partial x} \right\|_{0, K}^{2} + h_{2}^{2} \left\| \frac{\partial^{3}u}{\partial x^{2}\partial y} \right\|_{0, K}^{2} \right) \right]^{1/2} \\ &\leq C\varepsilon^{1/2}. \end{aligned}$$

Above all, we have

$$\sup_{w_N \in V_{N0}} \frac{|F_N(u, w_N)|}{\|w_N\|_{\varepsilon, N}} \leq C \min \left\{ \varepsilon^{1/2}, \varepsilon^{-3/2} N^{-2} \right\}.$$

Choose $f = 2\pi^2 [1 - \cos(2\pi x) \cos(2\pi y)]$. The exact solution of this problem is unknown (but it is known to contain boundary layers when ε is small), so to estimate errors and rates of convergence we use the double-mesh principle.
