$$\text{curl}(a, b) = \left( \frac{\partial b}{\partial x}, -\frac{\partial a}{\partial y} \right)$$

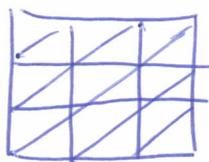

(!)<sub>p</sub>

Braess : Finite Elements

Classical Def FE is a triple  $(T, \Pi, \Sigma)$

(2)

- $T$  is a polyhedron
- $\Pi$  is a subspace of the Hilbert space
- $\Sigma$  is a set of linear independent functionals over  $\Pi$ . Every  $p \in \Pi$  is uniquely determined by the functionals from  $\Sigma$  (unisolvance)

- Decompose into triangles
- Basis functions for  $\Pi$
- Conditions for conformity (subspace of Hilbert space)

Let us consider a conforming FE method, i.e.

$$\forall u \in V$$

Find  $u \forall v: a(u, v) = F(v)$  (\*) a bilinear,  $F$  linear

instead solve

Find  $u_h \forall v_h: a(u_h, v_h) = F(v_h)$  (\*\*)  
 $\uparrow$   $\uparrow$   
 $V_h$   $V_h$

Let us suppose we have a solution for (\*\*) then

$$\|u - u_h\|_a = \inf_{v_h \in V_h} \|u - v_h\|_a \quad \text{Best approximation} \\ (\leftarrow \min)_p$$

$$\|a\|_a^2 = a(u, u)$$

$$a(u, v_h) = F(v_h) \quad \forall v_h \in V_h$$

$$- a(u_h, v_h) = F(v_h)$$

---

$$a(u - u_h, v_h) = 0$$

$$\underbrace{\quad}_{=0}$$

Galerkin - orthogonality

$$\begin{aligned} \|u - u_h\|_a^2 &= a(u - u_h, u - u_h) \\ &= a(u - u_h, u - u_h - v_h) \\ &\leq \|u - u_h\|_a \|u - u_h - v_h\|_a \quad \text{CS} \end{aligned}$$

$$\Rightarrow \|u - u_h\|_a^2 \leq \|u - u_h - v_h\|_a$$

$$\Rightarrow \|u - u_h\|_a \leq \inf_{v_h \in V_h} \|u - v_h\|_a \quad \text{Best approximation}$$

$\Rightarrow$  error is small if  $V_h$  is rich

The richness of  $V_h$  is measured by interpolation error estimates

$$\|u - I_h u\|_a \leq C(h, u, f)$$

$$I_h: V \rightarrow V_h$$

To compute such error estimates for  $I_h$  the so called Bramble-Hilbert-lemma is often used:

$\Omega \subset \mathbb{R}^2$  Lipschitz and  $L: H^k(\Omega) \rightarrow Y$  (lin., bounded)<sub>p</sub>

$$P_{k-1} \subset \text{ker } L$$

$$\Rightarrow \|L u\|_Y \leq \|L\|_Y \cdot |u|_{H^k(\Omega)} \quad (C \|L\| |u|_{H^k(\Omega)})_p$$

$\nwarrow$  semi-norm

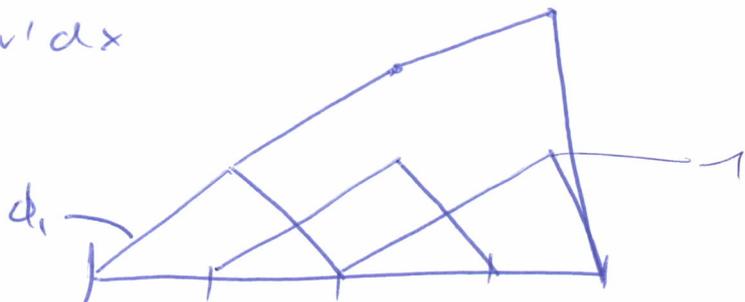

Simplest case:  $v \in C_0^\infty([0,1]) = \dot{C}^\infty([0,1])$ ,  $v \in C^\infty([0,1])$ ,  $v(0) = v(1) = 0$

1D:  $u'' = 1$ ,  $u(0) = u(1) = 0$ ,  $[0,1]$

$$\int_0^1 1 \cdot v = \int_0^1 u'' v dx = - \int_0^1 u' v' dx + u' v \Big|_0^1 = - \int_0^1 u' v' dx$$

$$a(u, v) = - \int_0^1 u' v' dx$$

$$F(v) = \int_0^1 1 v dx$$

$V_h =$  space of piecewise linear functions that are continuous  
 $=$  ~~space~~ span of that functions (affine linear)<sub>p</sub>

$$V_h = \text{span} \{ \phi_1, \dots, \phi_n \}$$

④

$$v_h = \sum_{i=1}^n v_i \phi_i \quad v = (v_1, v_2, \dots, v_n)$$

Putting them into eq gives

$$\sum_{i,j} v_i u_j a(\phi_i, \phi_j) = \sum_i v_i f(\phi_i) \quad \forall v_h = (v_1, \dots, v_n)$$

$(\Rightarrow \langle k u, v \rangle = \langle f, v \rangle)$ 
(← F)<sub>p</sub>

Choose  $v$  as  $e_1, \dots, e_n$

$$k u = f$$

$$k = (a(\phi_i, \phi_j))_{i,j}$$

Stiffness matrix

$$f = (f(\phi_i))_{i,1}$$

Load vector

$$a(u_h, v_h) = f(v_h) \quad \forall v_h \Leftrightarrow k u = f$$

Exercise :  $k = \tau, f = z$ .

Conformity Conditions  $H^1, H(\text{div}), H(\text{curl})$

Patching Conditions

$H^k(\Omega)$

Let  $\Omega \subset \mathbb{R}^d$  and  $\tau$  a triangulation.

Divide FE by  $T \in \tau$ .

Then for  $k \geq 1$ . A function  $v: \Omega \rightarrow \mathbb{R}$  which is piecewise  $C^k(\Omega)$  is in  $H^k \Leftrightarrow v \in C^{k-1}(\Omega)$ .

" $\Leftarrow$ " (Important direction)

$$\int_{\Omega} v \text{div} \varphi \, dx = \sum_{T_j} \int_{T_j} v \text{div} \varphi \, dx \quad \text{"Green's formula"}$$

$$= \sum_{T_j} - \int_{T_j} \text{div} \varphi \, dx + \int_{\partial T_j} \varphi \nu \nu_i \, ds$$

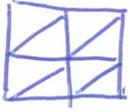

$$\stackrel{!}{=} \int_{\Omega} - \text{div} \varphi \, dx$$

where  $\text{div}$  is the well defined weak derivative of  $v$   
(and it is defined piecewise)

(5)

For this to hold the term over the secondary faces  
should vanish; This is the case since (in our case)

since  $v$  is continuous and  $\varphi$  has compact support in  $\Omega$ .

(Traces!)  $H^{\frac{1}{2}}_p$

$H(\text{div})$  -conformity

$\forall v \in H(\text{div}, \Omega)$ :

Green's formula

$$\int_{\Omega} v \cdot \text{grad} \varphi \, dx = - \int_{\Omega} \text{div} v \, \varphi \, dx + \int_{\partial \Omega} \varphi \cdot v \cdot \nu \, ds$$

Let  $v$  be our FE function and  $\varphi$  with compact support

$$\int_{\Omega} v \cdot \text{grad} \varphi \, dx = \sum_{T_j} \int_{T_j} v \cdot \text{grad} \varphi \, dx$$

$$= \sum_{T_j} \left( - \int_{T_j} \text{div} v \, \varphi \, dx + \int_{\partial T_j} \varphi \, v \cdot \nu \, ds \right)$$

$$\stackrel{!}{=} - \int_{\Omega} \text{div} v \, \varphi \, dx \quad (\text{Traces! } H^{-\frac{1}{2}})_p$$

Here the second term vanishes (for  $\varphi$  with compact support)  
of the integral of the normal component of  $v$   
is identical from both sides of an edge (face).

This condition is especially fulfilled if the normal component is continuous across edges.

$\Rightarrow \text{div} v$  is well defined.

$$\int_{\Omega} \langle v, \text{curl } w \rangle dx = \int_{\Omega} \langle \text{curl } v, w \rangle dx - \int_{\partial \Omega} \langle v \times \nu, w \rangle dx$$

$H(\text{curl})$  - conformity

$$\begin{aligned} \int \langle v, \text{curl } w \rangle dx &= \int \sum_{T_S} \langle v, \text{curl } w \rangle dx && (\text{Traces! } H^{-\frac{1}{2}})_p \\ &= \sum_{T_S} \left( \int_{T_S} \langle \text{curl } v, w \rangle dx - \int_{\partial T_S} \langle v \times \nu, w \rangle dx \right) \\ &\stackrel{!}{=} \sum_{T_S} \int_{T_S} \langle \text{curl } v, w \rangle dx \end{aligned}$$

For this (!) to hold it suffices that  $v \times \nu$  is identical from both sides of an edge (face).

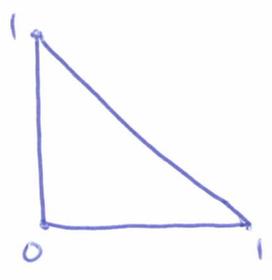

$\Rightarrow$   $\text{curl } v$  is well defined;  $v \in H(\text{curl})$

Implementing Conforming  $H^1$ -elements

$$a(u, v) = \int_{\Omega} (\text{grad } u)^T \text{grad } v dx, \quad \Omega = (0, 1)^2$$

$$F(v) = \int_{\Omega} \phi v dx$$

Tri $\phi$

basis  $\phi_1, \phi_2, \phi_3$

where  $\phi_i(p_j) = \delta_{ij}$ ,  $\phi_i$  linear (affine linear)<sub>p</sub>

$\phi = (\phi_1, \phi_2, \phi_3)^T$   
basis functions eval

$$u_h = u_T^T \phi$$

$$K_T = \int_T (\text{grad } u_h)^T \text{grad } v_h \, dx \quad (7)$$

$$= \int_T u_T^T \mathcal{D}\varphi (\mathcal{D}\varphi)^T v_T \, dx$$

~~scribble~~  
 $(\partial_i u_h = u_{Tj} \partial_i \varphi_j)$

$$= u_T^T \int_T \mathcal{D}\hat{\varphi} \mathcal{B} (\mathcal{B}^{-T} (\mathcal{D}\hat{\varphi})^T) |\det \mathcal{B}| \, dx v_T = (\varphi^T u_T)_c$$

$(\cdot)_p \nearrow$   
 $T_{ref}$

$(\cdot)_p \nearrow$   
 $\Rightarrow \text{grad } u_h = \varphi^T u_T$   
 $= \mathcal{D}\varphi^T u_T$

$$f_T = v_T \int_T \hat{\varphi} \varphi(\mathcal{B}x + d) |\det \mathcal{B}| \, dx$$

$(\cdot)_p \nearrow$   
 $T_{ref}$

For a triangle  $\tilde{\omega}$  in 2D with corners  $a_1, a_2, a_3$

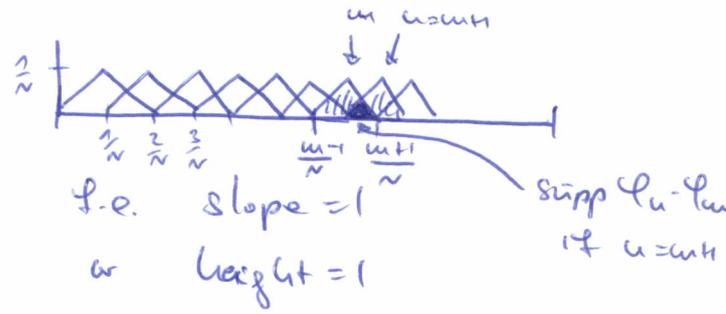

$$\mathcal{B} = (a_2 - a_1, a_3 - a_1)$$

# Exercise 1

$$u'' = 1, \quad u(0) = u(1) = 0$$

$$t \in [0, 1], \quad t_n = \frac{t}{N}$$

$$\varphi_1(t) = \begin{cases} t & , t \in [0, \frac{1}{N}] \\ -t + \frac{2}{N} & , t \in [\frac{1}{N}, \frac{2}{N}] \end{cases}$$

$$\varphi_u(t) = \varphi_1(t - \frac{u-1}{N})$$

$$\text{supp } \varphi_u = [\frac{u-1}{N}, \frac{u+1}{N}]$$

$$= \begin{cases} t - \frac{u-1}{N} & , t \in [\frac{u-1}{N}, \frac{u}{N}] \\ -t + \frac{2}{N} + \frac{u-1}{N} & , t \in [\frac{u}{N}, \frac{u+1}{N}] \end{cases}$$

$$= -t + \frac{u+1}{N}$$

$$\Rightarrow \varphi_n, \quad n = 1, \dots, N-1$$

$$a(u, v) = - \int_0^1 u' v' dx, \quad F(v) = \int_0^1 v dx$$

$$a(\varphi_i, \varphi_j) = - \int_0^1 \varphi_i'(t) \varphi_j'(t) dt = 0, \quad \text{if } i \neq j \in \{0, \pm 1\}$$

$$\varphi_u'(t) = \begin{cases} 1 & , t \in [\frac{u-1}{N}, \frac{u}{N}] \\ -1 & , t \in [\frac{u}{N}, \frac{u+1}{N}] \end{cases}$$

$$\Rightarrow a(\varphi_u, \varphi_m) = \begin{cases} - \int_{\frac{u-1}{N}}^{\frac{u+1}{N}} 1 dt = -\frac{2}{N}, & u = m \\ - \int_{\frac{u}{N}}^{\frac{u+1}{N}} \varphi_u' \varphi_m' dt, & u = m+1 \\ - \int_{\frac{u-1}{N}}^{\frac{u}{N}} (-1) dt = \frac{1}{N} & u = m-1 \end{cases}$$

(sym.)

(9)

$$\Rightarrow k = \frac{1}{N} \begin{bmatrix} -2 & 1 & 0 \\ 1 & -2 & 1 \\ 0 & 1 & -2 \end{bmatrix}$$

$$\Phi(\varphi_u) = \int_0^1 \varphi_u(t) dt = |\Delta| = \frac{1}{N^2}$$

$$\Rightarrow \varphi = \frac{1}{N^2} \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix}$$

$$\Rightarrow k \in \mathcal{M}(\mathbb{R}^{(N-1) \times (N-1)}), \quad \varphi \in \mathbb{R}^{N-1}$$

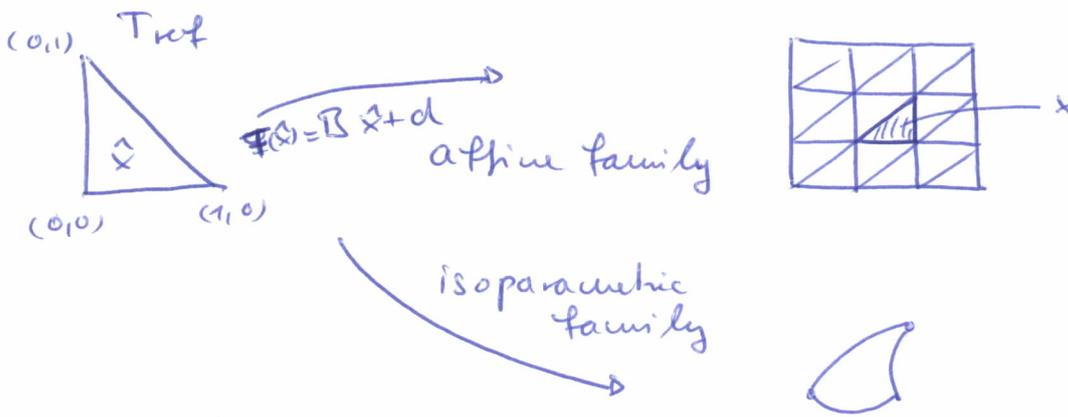

$$k u = \varphi \Leftrightarrow \tilde{k} u = \tilde{\varphi}$$

$$\tilde{k} = \begin{bmatrix} -2 & 1 & 0 \\ 1 & -2 & 1 \\ 0 & 1 & -2 \end{bmatrix}, \quad \tilde{\varphi} = \frac{1}{N} \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix}$$

Then

$$u_h = \sum_{u=1}^N u_u \varphi_u(t), \quad u_h(t_n) = u_u \underbrace{\varphi_u(t_n)}_{= \frac{1}{N}} = \frac{1}{N} u_u$$

put the vector  $U := \begin{bmatrix} u_h(t_0) \\ \vdots \\ u_h(t_N) \end{bmatrix} = \frac{1}{N} \begin{bmatrix} u_1 \\ \vdots \\ u_{N-1} \\ 0 \end{bmatrix}$

$$\hat{q}(x) = \phi(x)$$

Consider one element  $T$   
 $\phi_1, \dots, \phi_m$  basis functions on  $T$  with local numbering

$$\phi = \begin{bmatrix} \phi_1 \\ \vdots \\ \phi_m \end{bmatrix}, \quad D\phi(x) = D(\hat{\phi} \circ F^{-1})(x) = D\hat{\phi}(\hat{x}) \underbrace{D F^{-1}(x)}_{= B^{-1}}$$

$$\Rightarrow k_T = \int_T D\phi (D\phi)^T, \quad k = (a(\phi_i, \phi_j))_{i,j}$$

$$= \int_{T_{ref}} D\hat{\phi} B^T B (D\hat{\phi})^T |\det B| d\hat{x}$$

$$f_T = \int_{T_{ref}} \hat{\phi} \phi(F(x)) |\det B| d\hat{x}$$

$$k = \sum R_T^T k_T R_T$$

Recall  $k = (a(\phi_i, \phi_j))_{i,j}$

$$k_T = (a(\phi_h, \phi_e))_{h,e} \quad (\text{local numbering})$$

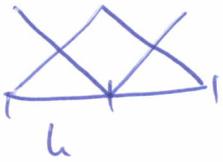

Then let  $r = \tau(T, h)$  be the translation from local to global numbering. Then

$$r_{i'h}^{(T)} = 1 \quad \text{if } r = \tau(T, h)$$

$$r_{i'h} = 0 \quad \text{otherwise}$$

$$h = \begin{pmatrix} 1 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix} h_T \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{pmatrix} + \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} h_T \begin{pmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix}$$

(10)

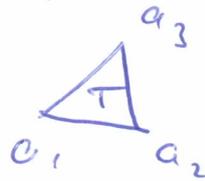

$$h_T = \frac{1}{h} \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix}$$

$$\frac{1}{h} \begin{pmatrix} 1 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 1 \end{pmatrix} u = h \begin{pmatrix} \frac{1}{2} \\ 1 \\ \frac{1}{2} \end{pmatrix}$$

$$B = (a_2 - a_1, a_3 - a_1)$$

## Raviart-Thomas of Arbitrary Order

( $H(\text{div})$  - elements)

Let  $P_k(\mathcal{E})$  be the space of polynomials of degree  $\leq k$ ,  $\tilde{P}_k(\mathcal{E})$  with  $k = k$ .

The construction of RT-space follows the following philosophy

- choose basis functions from  $P_{k+1}$
- ensure conformity condition for  $H(\text{div})$

This will be achieved by

- demanding that  $\hat{\varphi}$  restricted to a face/edge is of degree  $\leq k$
- introducing enough degrees of freedom to ensure continuity of normal component

$$RT_K(\Omega) = P_K(\Omega)^d + x \tilde{P}_K(\Omega)$$

(12)

We can write  $RT_K(\Omega)$  in 3D

$$RT_K(\Omega) = P_K(\Omega)^d + \{ q \in \tilde{P}_{K+1}(\Omega)^d : \underbrace{x+q=0}_{x \parallel q} \}$$

conformity?

$$\langle v, p+xq \rangle = \langle v, p \rangle + \langle v, x \rangle q$$

$$\begin{matrix} \uparrow & \uparrow \\ P_K(\Omega)^d & P_K(\Omega) \end{matrix} = \langle v, p \rangle + \text{constant} \cdot q \in P_K(\Omega)$$

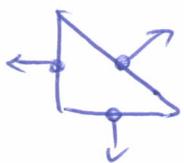

If we now (2d)  $(h+1)$  dof on each face/edge then the polynomials on the face/edge is uniquely determined (from both sides and therefore the normal component is continuous.)

The dimension of  $RT_K$  in 2D:  $(h+1)(h+3)$

3D:  $\frac{1}{2}(h+1)(h+2)(h+4)$

2D:  $h=0$ ;  $p = \begin{pmatrix} a \\ b \end{pmatrix} + c \begin{pmatrix} x \\ y \end{pmatrix}$ , dof  $a, b, c \quad \# = 3$

on the reference triangle the normal components are

$$\langle \begin{pmatrix} a \\ b \end{pmatrix} + c \begin{pmatrix} 0 \\ 1/2 \end{pmatrix}, \begin{pmatrix} -1 \\ 0 \end{pmatrix} \rangle = -a$$

$$\langle \begin{pmatrix} a \\ b \end{pmatrix} + c \begin{pmatrix} 1/2 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ -1 \end{pmatrix} \rangle = -b$$

$$\langle \begin{pmatrix} a \\ b \end{pmatrix} + c \begin{pmatrix} 1/2 \\ 1/2 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \rangle = a+b+c$$

We will now use the normal components at edge midpoints as dof.

We have defined new dot by functionals

(13)

$\langle u, v \rangle$  therefore we can write dot

$$\boxed{f \mapsto \int_e \langle \psi(u), \psi(v) \rangle ds}$$

(use midpoint quadrature to get)

3D :  $h=0$

$$p = \begin{pmatrix} a \\ b \\ c \end{pmatrix} + d \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

# dof 4

$h=1$

$$p = \begin{pmatrix} a_1 + a_2 x + a_3 y + a_4 z \\ b_1 + b_2 x + b_3 y + b_4 z \\ c_1 + c_2 x + c_3 y + c_4 z \end{pmatrix} + (a_5 + b_5 y + c_5 z) \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

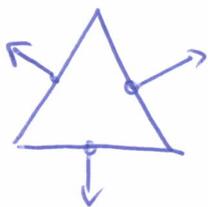

# dof = 15

2D :  $h=1$

$$p = \begin{pmatrix} a + b x + c y \\ d + e x + f y \end{pmatrix} + (g x + h y) \begin{pmatrix} x \\ y \end{pmatrix}$$

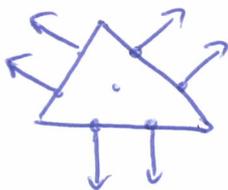

# dof = 8

2D  $h=0$

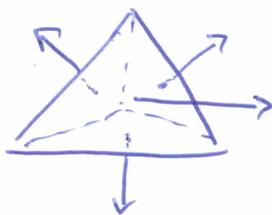

dof 3

$h=1$

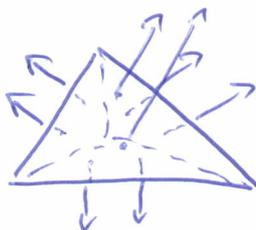

3D  $h=0$

dof 4

$h=1$

# Nédélec-Elemente (H(curl)-elemente)

(19)

$$N_k(\Omega) = P_k(\Omega)^d + \{q \in \tilde{P}_{k+1}(\Omega)^d, \langle x, q \rangle = 0\}$$

Demok  $\varphi \mapsto \int_c \langle \varphi(s), t(s) \rangle ds$

lowest order  $N_0$

$$p = \begin{pmatrix} a \\ b \end{pmatrix} + c \begin{pmatrix} y \\ -x \end{pmatrix}$$

$$N_1, \quad p = \begin{bmatrix} a + cx + dy \\ b + fx + gy \end{bmatrix} + \begin{pmatrix} c y^2 + f x y \\ g y^2 - d x y \end{pmatrix}$$

3D 1st order  $P_0(\Omega) + p$

with 
$$p = \begin{pmatrix} a_1 x_1 + b_1 x_2 + c_1 x_3 \\ a_2 x_1 + b_2 x_2 + c_2 x_3 \\ a_3 x_1 + b_3 x_2 + c_3 x_3 \end{pmatrix}$$

$\langle x, p \rangle = 0$  gives

$$a_1 x_1^2 + b_2 x_2^2 + c_3 x_3^2 + (b_1 + a_2) x_1 x_2 + (c_1 + a_3) x_1 x_3 + (c_2 + b_3) x_2 x_3 = 0$$

$$\Rightarrow a_1 = b_2 = c_3 = 0, \quad b_1 = -a_2, \quad c_1 = -a_3, \quad c_2 = -b_3$$

$$\Rightarrow p = \begin{pmatrix} b x_2 + c x_3 \\ -b_1 x_1 + d x_2 \\ -c x_1 - d x_2 \end{pmatrix} = \begin{pmatrix} \pm d \\ \pm c \\ \pm b \end{pmatrix} \times x$$

FEEC

Polynomial Differential Forms

$P_k(\Omega)$  polyn  $\leq k$  with  $d = \dim \Omega$  variables

$$\dim P_k(\Omega) = \binom{k+d}{d} = \frac{(k+d)!}{k!d!}$$

$$P_k(\Omega) = \sum_{c_1 + \dots + c_d \leq k} a_{c_1, \dots, c_d} x_1^{c_1} \dots x_d^{c_d}, \quad a_{c_1, \dots, c_d} \in \mathbb{R}$$

$$\tilde{P}_k(\Omega) = \sum_{c_1 + \dots + c_d = k} a_{c_1, \dots, c_d} x_1^{c_1} \dots x_d^{c_d}$$

Definition Define  $P_k^q(\Omega)$  polynomial  $q$ -forms of degree  $\leq k$  as  $\omega \in A^q(\Omega)$  where

$$\omega = \sum_I P_I dx^I$$

where  $P_I \in P_k(\Omega)$ ,

i.e. the coefficient functions of the forms are polynomials of degree  $\leq k$ . Write  $\tilde{P}_k^q(\Omega)$  for the space of polynomial  $q$ -forms of degree  $= k$ , i.e.

$$P_I \in \tilde{P}_k(\Omega)$$

Definition We call a FE space defined by piecewise polynomial  $q$ -forms on a triangulation  $\tau$  from  $P_k^q(T)$  conform if

$$\omega \in \mathcal{D}^q(\Omega)$$

or in other words

$$\|\omega\| + \|d\omega\| < \infty$$

this is equivalent to the classical setting

where  $v_u \in L_2(\Omega)$ ,  $\begin{pmatrix} \text{grad} \\ \text{curl} \\ \text{div} \end{pmatrix} v_u \in L_2$ .

3D:

$$0 \rightarrow P_{1k}^0(\Omega) \xrightarrow{d} P_{1k-1}^1(\Omega) \xrightarrow{d} P_{1k-2}^2(\Omega) \xrightarrow{d} P_{1k-3}^3(\Omega) \xrightarrow{d} 0$$

$$2D: 0 \rightarrow P_k^0(\Omega) \xrightarrow{d} P_{k-1}^1(\Omega) \xrightarrow{d} P_{k-2}^2(\Omega) \xrightarrow{d} 0$$

"polynomial de Rham complex"

this is also valid for  $\tilde{P}_k^3(\Omega)$ .

Exercice 2

$\Omega = (0,1)^2 \quad u, v \in H^1(\Omega)$

$-\Delta u = 1$

~~$a(u, v) =$~~

$\langle -\Delta u, v \rangle_{\Omega} = -\int_{\Omega} \Delta u v \, d\lambda = \int_{\Omega} \langle \nabla u, \nabla v \rangle - \int_{\partial \Omega} \partial_{\nu} u \cdot v \, d\sigma$   
 $= \langle f, v \rangle_{\Omega}$

$\Rightarrow a(u, v) = \langle \nabla u, \nabla v \rangle_{\Omega} = \langle f, v \rangle = F(v) \quad \forall v$

$u = \sum u_n \phi_n, \quad v = \sum v_n \phi_n$

$\Rightarrow a(u, v) = u_n v_m \langle \nabla \phi_n, \nabla \phi_m \rangle_{\Omega}$   
 $= u_n \underbrace{a(\phi_n, \phi_m)}_{=k} v_m$   
 $= \langle \vec{u}, k \vec{v} \rangle = \vec{u}^T k \vec{v} = \langle k \vec{u}, \vec{v} \rangle$  *k sym.*

$F(v) = v_n \underbrace{\langle f, \phi_n \rangle_{\Omega}}_{=f_n} = \langle \vec{f}, \vec{v} \rangle$

$\forall \vec{v} = 0 \quad k \vec{u} = \vec{f}$

$k_{nm} = \int_{\Omega} \langle \nabla \phi_n, \nabla \phi_m \rangle \, d\lambda = \sum_T \int_T \langle \nabla \phi_n, \nabla \phi_m \rangle \, d\lambda$

$= \sum_T \int_{T \circ F^{-1}} \langle \nabla \hat{\phi}_n \circ F^{-1}, \nabla \hat{\phi}_m \circ F^{-1} \rangle \underbrace{|\det F^{-1}(x)| \, dx}_{=B_T}$

~~Das kann~~  
 This can not be possible.  
 $\varphi_u \notin H^1(I)$   
 $\uparrow$   
 or  $H^1(I)$   
 combination by 0 to I

$$k = \sum_T R_T^T k_T R_T$$

$$= (\alpha(\phi_i, \phi_j))_{i,j}$$

$$\alpha(\phi_i, \phi_j) = \int_{\Omega} \nabla \phi_i \cdot \nabla \phi_j \, dx$$

$$= \int_{\text{supp } \phi_i \cap \text{supp } \phi_j} \nabla \phi_i \cdot \nabla \phi_j \, dx = \sum_{T \in \text{supp } \phi_i \cap \text{supp } \phi_j} \int \nabla \phi_i \cdot \nabla \phi_j \, dx$$

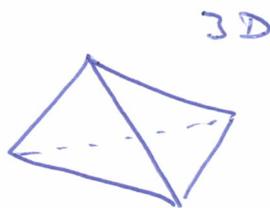

$$\omega = \sum_I p_I(x) \, dx_I$$

$$H^1 \quad (d_1, d_2, \dots) \rightarrow \phi_1 \, dx_1 \in A^1(T)$$

$$H(\text{div}) \quad (d_1, d_2, d_3) \rightarrow \phi_1 \, dx_2 \wedge dx_3 + \phi_2 \, dx_1 \wedge dx_3 + \phi_3 \, dx_1 \wedge dx_2$$

For a polynomial differential form  $\omega$  we choose the values

$$k = \int_{\mathbb{F}} \omega \wedge \sum_{i \in \mu} z_i$$

3D volume  
 $\Delta_2$  set of faces  
 $\Delta_1$  set of edges  
 $\Delta_0$  points

where  $\varphi \in \Delta_\mu(T)$ ,  $0 \leq \mu \leq d$

$$z \in P_{k-(\mu-1)}^{\omega-1}(\mathbb{F})$$

Lowest order  $N$  in  $2D$   $K(\bar{u}, \bar{v})$

$h=0$

$$p = \begin{pmatrix} a \\ b \end{pmatrix} + c \begin{pmatrix} y \\ -x \end{pmatrix}$$

$$\omega = (a+cy) dx_1 + (b+cx) dx_2$$

$u = 0, 1, 2 ; q = 1$

for  $u=2$   $\{ \in P_{0-2+1}^{2-1} = P_{-1}^1 := \{0\}$

for  $u=1$   $\{ \in P_{0+1-1}^{1-1} = P_0^0 = \text{constants}$

for  $u=0$   $\{ \in P_{0-0+1}^{0-1} = P_1^{-1} = \{0\}$

Thus for  $N_0$  ( $h=0$ )

$$\int_e \underbrace{\omega \wedge 1}_{= \omega \cdot 1 = \omega} \quad e \text{ an edge in } 2D$$

Consistency condition using Diff. Forms

$$\langle E, H \rangle_\pi = \int_\pi E \wedge H \quad (= \int_\pi \langle E, H \rangle \overbrace{\star 1}^{= \omega} = \int_\pi \langle E, H \rangle dx)$$

Product rule

$$d(E \wedge H) = dE \wedge H + E \wedge \delta H$$

and

$$d(\omega \wedge z) = d\omega \wedge z + \omega \wedge dz$$

$\Downarrow$

$$\langle dE, H \rangle_\pi + \langle E, \delta H \rangle_\pi = \int_\pi dE \wedge H + E \wedge \delta H$$

$$= \int_\pi d(E \wedge H) = \int_\pi \star \star (E \wedge H)$$

$$= \int_{\partial \pi} \star E \wedge \star H = \int_{\partial \pi} \langle \delta_t E, \delta_u H \rangle = 0$$

$H^1$  read  $dE$  as the gradient and  $\delta_t E = E$

$H$  is the test function with compact support

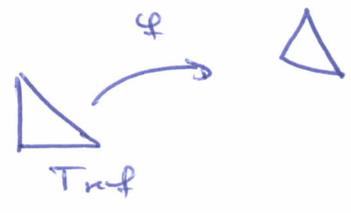

$H(\text{div}, \varepsilon)$  choose  $E$  as  $(d-1)$ -form and  $H$  as test function with compact support

$(d=3)$   $H(\text{curl}, \varepsilon)$  choose  $E$  as  $(d-2)$ -form and  $H$  as test function with compact support.

We can then obtain uniformity for a piecewise smooth form  $w$  (piecewise  $C^\infty$ , piecewise polynomial) if the correct ~~face~~ trace is continuous over  $\mathbb{F} \in \Delta_{d-1}$ .

Polynomial Space

Affine Invariance of  $P_K^q$   
of affine function

$\varphi^*(P_K^q(\Omega)) \subset P_K^q(\Omega) \quad (=)$

Affine Families

$v \circ \varphi = \hat{p}(\underbrace{\varphi^{-1}(x)}_{\text{affine mapping}})$       $\hat{p} \in \Pi_{\text{ref}}$

- the functionals  $d(v)$  are defined on  $T_{\text{ref}}$

Agar's HCT ( $C^1$ -elements; are not affine families)

How to find ~~the~~ affine invariant polynomial spaces other than  $P_K^q$ ?

$\varphi^* d P_{hH}^{q-1} = d \varphi^* P_{h+1}^{q-1} \subset d P_{hH}^{q-1}$

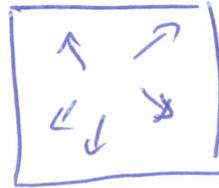

$\Rightarrow d P_{hH}^{q-1}$  is affine invariant

There exist an operator

$$d(\pi(\omega)) = \omega \quad , \text{ if } d\omega = 0$$

potential operator

There is an explicit formula for computing  $\pi(\omega)$

$d\omega = 0 \Leftrightarrow$  vector field  $u$  is conservative, curl free, irrotational, is a gradient field

compute potential  $\nabla p = u$

$$\varphi^* \pi(\tilde{P}_{h-1}^{q+1}) = \pi \varphi^* \tilde{P}_{k-1}^{q+1} \subset \pi \tilde{P}_{h-1}^{q+1}$$

only for linear  $\varphi$

$\pi(\tilde{P}_{h-1}^{q+1})$  is not affine invariant

$$\begin{aligned} P_k^q \subset P_{h+1}^q &= P_k^q \oplus \pi \tilde{P}_k^{q+1} && \text{is affine invariant} \\ &\subset P_{h+1}^q && \uparrow \\ &&& \tilde{P}_h^{q+1} \text{ restricted to closed forms} \\ &&& d p = 0 \end{aligned}$$

$$\sum_k \tilde{P}_k^{q+1} = d \tilde{P}_{h+1}^q \quad \left( \begin{smallmatrix} ? \\ - \end{smallmatrix} \right)_p$$

$$\begin{aligned} \text{RT} & P_k(\tau) + \{ P_k(\tau) \}^d \quad (p \times x = 0) \\ N & \quad \langle p, x \rangle = 0 \end{aligned}$$

### Implementing Raviart-Thomàs RT

Consider a mixed system  $u=0$  on  $\partial\Omega$

$$\int_{\Omega} q p \, dx - \int_{\Omega} \text{div } q \cdot u \, dx = 0$$

$$\int_{\Omega} v \, \text{div } p \, dx \stackrel{=}{=} \int_{\Omega} \varphi v \, dx$$

Find  $(p, u) \in ~~H(\text{div})~~ H(\text{div}) \times L_2(\Omega)$

Choose basis  $\varphi_i$

for  $p_i \in \text{RT}_0$ ,

$d_i$  for  $u_i \in P_0$

(piecewise constant)

$$u = \sum_{i=1}^M u_i d_i$$

$$v = \sum_{i=1}^M v_i d_i$$

$$p = \sum_{i=1}^M p_i \varphi_i$$

$$q = \sum_{i=1}^M q_i \varphi_i$$

$$\int_{\Omega} (p - \nabla u) \cdot q \, dx = 0$$

$$\int_{\Omega} (\varphi + \text{div}) p \cdot v \, dx = 0$$

$$\Rightarrow \begin{aligned} \nabla u &= p \\ \text{div } p &= -\varphi \end{aligned}$$

$$\Rightarrow \underbrace{-\Delta u = 0 + f}_{u|_{\partial\Omega} = 0} \quad | \quad (!)_p$$

$$\downarrow$$

$$\sum_{i,j=1}^u q_i p_i \int_{\Omega} \varphi_i \varphi_j dx - \sum_{i=1}^u \sum_{k=1}^u q_i u_k \int_{\Omega} \text{div} \varphi_i \phi_k dx = 0$$

$$\sum_{i=1}^u \sum_{k=1}^u v_k p_i \int_{\Omega} \phi_k \text{div} \varphi_i dx$$

$$= - \sum_{k=1}^u v_k \int_{\Omega} f \phi_k dx$$

$$\downarrow$$

$$(q,v) \begin{pmatrix} B & C^T \\ C & 0 \end{pmatrix} \begin{pmatrix} p \\ u \end{pmatrix} = (q,v) \begin{pmatrix} 0 \\ -f \end{pmatrix} \quad \forall q,v$$

$$\begin{pmatrix} B & C^T \\ C & 0 \end{pmatrix} \begin{pmatrix} p \\ u \end{pmatrix} = \begin{pmatrix} 0 \\ -f \end{pmatrix}$$

$$B = \left( \int_{\Omega} \varphi_i \varphi_j dx \right)_{i,j=1,\dots,u}$$

$$C = \left( \int_{\Omega} \phi_k \text{div} \varphi_i dx \right)_{\substack{k=1,\dots,u \\ i=1,\dots,u}}$$

this is 1 on every element

Exercise 3

$\hat{\varphi}_i$  continued by 0 to all of  $\mathbb{R}$ !

1D:

$\hat{\varphi}_1(x) = x$

$\hat{\varphi} = \begin{bmatrix} \varphi_1 \\ \varphi_2 \end{bmatrix}, \hat{\varphi}' = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$

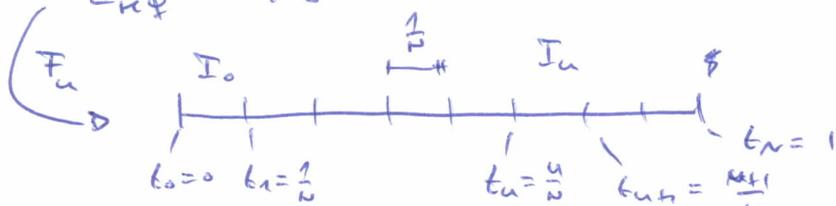

$\hat{\varphi}_2(x) = 1-x$

$I_{u,\varphi} = [0,1]$

$F_u(x) = Bx^T + d$

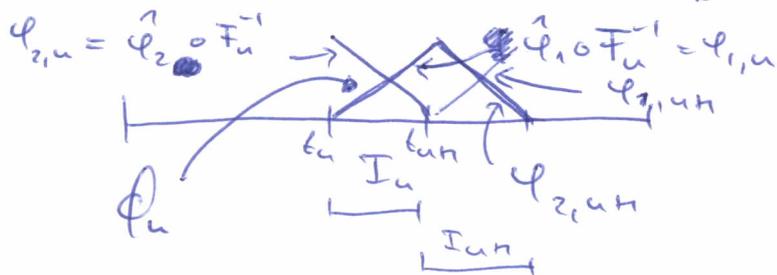

$= \frac{1}{u} x^T + \frac{u}{u} = x$

$F_u(x) = \frac{1}{u}$

$F_u^{-1}(x) = B^{-1}(x-d)$

$= N(x - \frac{u}{u}) = Nx - u$

$(F_u^{-1})'(x) = N$

basis functions:  $\tilde{\varphi}_u(x) = \alpha \varphi_{1,u}(x) + \beta \varphi_{2,u+h}(x)$

~~$= \alpha(Nx - u) + \beta(1 - Nx + u)$~~

$= \begin{cases} \alpha(Nx - u), & x \in I_u \\ \beta(1 - Nx + u), & x \in I_{u+h} \end{cases}$

$\lim_{x \rightarrow t_u} \varphi_u(x) = \alpha$

$= \beta = \lim_{x \rightarrow t_{u+h}} \varphi_u(x)$

$\alpha = \beta \Rightarrow \tilde{\varphi}_u(x) = \alpha \varphi_{1,u}(x) + \alpha \varphi_{2,u+h}(x)$

$\alpha = 1 \Rightarrow \varphi_u(x) = \begin{cases} Nx - u, & x \in I_u \\ 2 + u - Nx, & x \in I_{u+h} \end{cases}$

Then:

~~$a(\varphi_i, \varphi_j) = \int_{\Omega} \varphi_i \varphi_j dx = \sum_{u=0}^{N-1} \int_{I_u} \varphi_u^2(x) dx$~~

Then

$a(\varphi_i, \varphi_j) = \int_{\Omega} \varphi_i' \varphi_j' dx = \sum_{u=0}^{N-1} \int_{I_u} \varphi_i' \varphi_j' dx$

$c=j$ :

$$a(\phi_i, \phi_i) = \sum_{u=0}^{N-1} \int_{I_u} \phi_i' \phi_i' dx = \int_{I_i} \phi_i'^2 dx + \int_{I_{i+1}} \phi_i'^2 dx$$

$$= \int_{I_i} \phi_{1,i}'^2 dx + \int_{I_{i+1}} \phi_{2,i+1}'^2 dx$$

$$= \int_{I_i} (\hat{\psi}_1' \circ F_i^{-1}(x) \cdot (F_i^{-1})'(x))^2 dx \quad \text{with } x = F_i(\hat{x})$$

$$+ \int_{I_{i+1}} (\hat{\psi}_2' \circ F_{i+1}^{-1}(x) \cdot (F_{i+1}^{-1})'(x))^2 dx \quad \text{with } x = F_{i+1}(\hat{x})$$

$$= N^2 \int_{I_{ref}} (\hat{\psi}_1')^2 \frac{dx}{N} + N^2 \int_{I_{ref}} (\hat{\psi}_2')^2 \frac{dx}{N}$$

$$= N + N = 2N$$

$c=j+1$ , ~~xxxx~~

$$a(\phi_i, \phi_j) = \sum_{u=0}^{N-1} \int_{I_u} \phi_i' \phi_j' dx = \int_{I_{j+1}} \phi_{j+1}' \phi_i' dx$$

$$= \int_{I_{j+1}} \phi_{1,j+1}' \phi_{2,j+1}' dx$$

$$= \int_{I_{j+1}} \hat{\psi}_1' \circ F_{j+1}^{-1}(x) \cdot (F_{j+1}^{-1})'(x) \cdot \hat{\psi}_2' \circ F_{j+1}^{-1}(x) \cdot (F_{j+1}^{-1})'(x) dx$$

$$= N^2 \int_{I_{ref}} \hat{\psi}_1' \hat{\psi}_2' \frac{dx}{N}$$

$$= -N$$

$$\Downarrow$$
$$k = N \begin{bmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix}$$

Mixed Methods

The Laplace  $\Delta u = \operatorname{div} \operatorname{grad} u = -f$

$$\Rightarrow \begin{aligned} \operatorname{grad} u &= \sigma \\ \operatorname{div} \sigma &= -f \end{aligned}$$

$$(\sigma, u) \in L_2(\Omega)^d \times H^1(\Omega), \quad \forall (\tau, v) \in \dots$$

$$(\sigma, \tau)_{\Omega} - (\operatorname{grad} u, \tau)_{\Omega} = 0$$

$$(\sigma, \operatorname{grad} v)_{\Omega} = (f, v)_{\Omega}$$

~~Find  $(u, \lambda)$  such that for all  $(v, \mu)$~~

Find  $(u, \lambda)$  such that for all  $(v, \mu)$

$$a(u, v) + b(\lambda, v) = (f, v)$$

$$b(u, \mu) = (g, \mu)$$

(\*)

$$A u + B \lambda = f$$

$$B u = g$$

For the solution of saddle point problems the so called inf-sup condition is essential.

$$\inf_{\mu \in M} \sup_{v \in X} \frac{b(v, \mu)}{\|v\| \| \mu \|} > \beta > 0$$

(\*\*)

"Babuska - Brezzi - condition"

The saddle point problem  $(*)$  is uniquely solvable if  $a$  is elliptic on the kernel of  $B$ , i.e. (32)

$$a(v, v) \geq \alpha \|v\|^2 \quad \forall v \in V = \ker B \\ = \{ v : b(v, \mu) = 0 \quad \forall \mu \}$$

and  $(**)$  is satisfied.

$$\text{inf sup} \Leftrightarrow \sup_{v \in V} \frac{b(v, \mu)}{\|v\|} \geq \beta \|\mu\| \quad \forall \mu \in \Pi$$

$$b(\mu_1, v) = b(\mu_2, v) \quad \forall v \in V$$

$$0 = b(\mu_1 - \mu_2, v) \geq \beta \|\mu_1 - \mu_2\|$$

$$\Rightarrow \mu_1 = \mu_2 \quad \text{thus } b(\mu, v) = B^T \mu \text{ is injective (?)}$$

If inf sup condition is not fulfilled this will result in instability of numerical method, "oscillations", "checkerboard modes"

Stable discrete mixed methods have to fulfill a discrete inf sup-condition for  $V_h, M_h$ , with a parameter  $\beta$  independent of  $h$

$$\inf_{\mu \in M_h} \sup_{v \in V_h} \frac{b(v, \mu)}{\|v\| \|\mu\|} > \beta > 0 \quad \text{with } \beta \text{ independent of } h$$

For injectivity of  $B^T$  the condition

$$\inf_{\mu \in M_h} \sup_{v \in V_h} \frac{b(v, \mu)}{\|v\| \|\mu\|} > 0$$

would be sufficient. But then the operator  $B^T B$  may degenerate for  $h \rightarrow 0$ . (constant  $\beta$  becomes smaller and smaller)

It can be shown that the wfs condition is equivalent the existence of a decomposition of

$$X = V \oplus V^\perp, \quad \oplus = \oplus_a \geq$$

For  $u \in X$  there exist an orthogonal decomposition

$$u = v + w \quad \textcircled{1}$$

such that  $\|w\|_X \leq \beta^{-1} \|\beta u\|_H \quad \left(\geq\right)_P$

$$V = \{v \in X: \delta(v, \mu) = 0 \ \forall \mu \in \Gamma\}$$

Construction mixed FE spaces from Differential Forms calculus automatically fits a decomposition of the form  $\textcircled{1}$ . The condition  $\textcircled{*}$  has still to be shown.

This decomposition relies on exact sequences of the discrete de Rham complex.

$$\rightarrow P_{k+1}^{q-1}(\Omega) \xleftarrow{\delta_2} P_k^q(\Omega) \xleftarrow{\delta_{k+1}} P_{k-1}^{q+1}(\Omega)$$

If  $\Omega$  star shape then  $P_k^q$  can be decomposed into an orthogonal sum  $P_k^q(\Omega) = V \oplus V^\perp$

where  $V = \text{range}(d_k) = \text{ker}(d_{k+1})$   
 $V^\perp = \text{ker}(\delta_k) = \text{range}(\delta_{k+1})$

"discrete Hodge decomposition"

For this an interpolation operator  $\mathbb{I}_k$  satisfying

$$d \mathbb{I}_k u = \mathbb{I}_k du$$

is necessary. mesh regularity

$h_T = \text{diam } T$   
 $\delta_T = \text{radius of a sphere contained in } T$

shape regular  $C_1 \delta_T \geq h_T$

with constant uniform for the whole triangulation (34)

quasi uniform:

$$C_1 h_T \geq C_2 h_T \geq h_{\max}$$

$h_{\max}$  is diam  $T_{\max}$  the element with largest diameter.

$$\text{condition } C \omega T \leq h_T^d \leq \bar{C} \omega T \quad (35)$$

If you have (35) for continuous differential forms you can define an operator  $I_h$

$$\omega \in \mathcal{P}_{k-1}^q \quad \int_{\mathcal{F}} I_h \omega \wedge \nu = \int_{\mathcal{F}} \omega \wedge \nu \quad \forall \nu \in \mathcal{P}_{k-1}^{q-1}$$

for faces  $\mathcal{F} \in \Delta_{\text{int}}(\mathcal{T})$  with an estimate

$$\| \omega - I_h \omega \|_{L^q(\mathcal{F})} \leq C h^t | \omega |_{H^t(\mathcal{F})}, \quad \frac{d-q}{2} < t < k+1$$

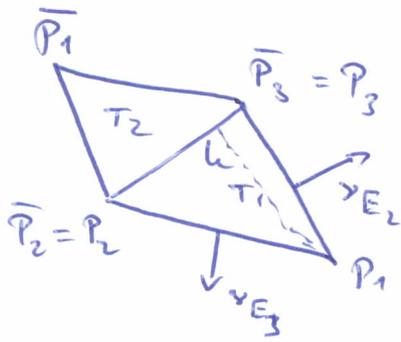

$$\mathcal{D}^q(x) \xrightarrow{d} \mathcal{D}^{q+1}(x)$$

The diagram

$$\begin{array}{ccc} \mathcal{D}^q(x) & \xrightarrow{d} & \mathcal{D}^{q+1}(x) \\ \downarrow I_h & & \downarrow I_h \\ \mathcal{P}_{k-1}^q & \xrightarrow{d} & \mathcal{P}_{k-1}^{q+1} \end{array}$$

commutes.

Element-like interpolation for non-continuous differential forms.

$$\chi_E|_{T_1} = \frac{|E|}{2|T_1|} (x - P_1)$$

$$\chi_E|_{T_2} = -\frac{|E|}{2|T_2|} (x - \bar{P}_1)$$

$$\chi_E \cdot v_{E_{R(i)p}} = \begin{cases} 1 & \text{on } E \\ 0 & \text{on other edges} \end{cases}$$

$$|T| = \frac{|E| \cdot G}{2}$$

$\chi_E$  lin. independent

$\chi_E$  explicit basis for  $\mathbb{R}T_0$  in 2D

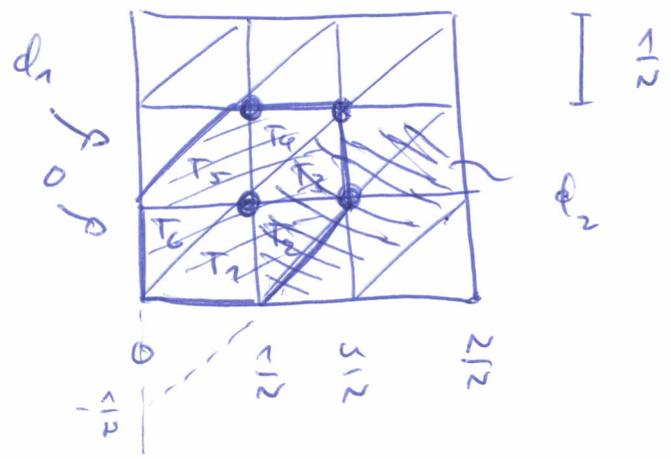

$$\text{div } \chi_E|_{T_{1/2}} = \pm \begin{cases} |E|/|T_{1/2}| & \text{on } T_{1/2} \\ 0 & \text{elsewhere} \end{cases}$$

Exercise 4

$$-\Delta u = f$$

$$u|_{\partial\Omega} = 0$$

$$\Omega = (0,1)^2$$

$\Rightarrow (N+1)^2$  points  
 $\Rightarrow (N-1)^2$  basis functions  
~~...~~  
 $6T \times 3 \text{ dof} = 18 \text{ dof}$   
 $\in H^1(\Omega) \Rightarrow \underline{\underline{1 \text{ dof}}}$

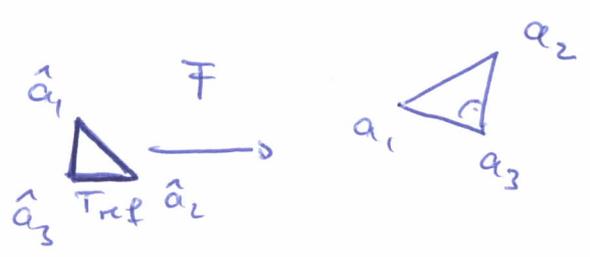

$$a(u,v) = \underbrace{u_v v_u \int_{\Omega} \nabla d_u \nabla d_v dx}_{= a(d_u, d_v)}$$

$$a(d_u, d_u) = \int_{\Omega} |\nabla d_u|^2 dx = \sum_{i=1}^6 \int_{T_i} |\nabla d_u|^2 dx$$

~~$$\sum_{i=1}^6 \sum_{j=1}^3 \int_{T_i} |\nabla d_u|^2 dx$$~~

$$d_u|_{T_i} = \sum_{s=1}^3 \psi_{s,u} = \psi_{s,u}$$

$$= \hat{\psi}_s \circ F$$

$$\begin{aligned} F(\hat{x}) &= B\hat{x} + d \\ F(\hat{a}_3) &= d = a_3 \\ F(\hat{a}_2) &= B \begin{pmatrix} 1 \\ 0 \end{pmatrix} + d = a_2 \\ F(\hat{a}_1) &= B \begin{pmatrix} 0 \\ 1 \end{pmatrix} + d = a_1 \end{aligned} \quad \left| \begin{aligned} \Rightarrow B &= B(b_i) = (a_2 - a_3 \quad a_1 - a_3) \\ \Rightarrow F(\hat{x}) &= (a_2 - a_3 \quad a_1 - a_3) \hat{x} + a_3 \\ \Rightarrow F'(\hat{x}) &= B = (a_2 - a_3 \quad a_1 - a_3) \\ F^{-1}(x) &= B^{-1}(x - a_3) \end{aligned} \right.$$
